

PROBLEM SET 9: REVIEW QUESTIONS

1. *Critique* the proof below: Proof is correct as is? Error in algebra or arithmetic? Stylistic errors? Logical errors?

Proposition: $\forall n \in \mathbb{N}, 1^2 + 2^2 + 3^2 + \dots + n^2 = n(n+1)(2n+1)/6$

Proof: For any n , let S_n be the statement $1^2 + 2^2 + 3^2 + \dots + n^2 = n(n+1)(2n+1)/6$.

Base Case: S_1 is true, since $1^2 = 1(1+1)(2+1)/6$

Inductive Step:

Assume that S_k is true for $\forall k \in \mathbb{N}$.

Then $1^2 + 2^2 + 3^2 + \dots + (k+1)^2 = (k+1)(k+1+1)(2(k+1)+1)/6$

$k(k+1)(2k+1)/6 + (k+1)^2 = (k+1)(k+1+1)(2(k+1)+1)/6$

Factoring: $(1/6)(k+1)\{k(2k+1) + 6(k+1)\} = (k+1)(k+2)(2k+3)/6$

$(1/6)(k+1)(2k^2 + 7k + 6) = (k+1)(k+2)(2k+3)/6$

Factoring the left-hand side:

$(k+1)(k+2)(2k+3)/6 = (k+1)(k+2)(2k+3)/6$

This is a true statement!

Thus we have shown that S_k is always true.

2. *Evaluate the proof of the following statement:*

Proposition: For all $n \in \mathbb{N}$, $4|(3^{2n} + 7)$.

Proof: For $n \in \mathbb{N}$ let S_n be the statement $4|(3^{2n} + 7)$.

Base Case: S_1 is true, since $3^2 + 7 = 16$ is divisible by 4.

Inductive Step:

For a given $k \geq 1$, assume that S_k is true, so that $4|(3^{2k} + 7)$. Then $3^{2k} + 7 = 4L$ for some $L \in \mathbb{Z}$.

Now, $3^{2(k+1)} + 7 = 9(3^{2k}) + 7 = 8(3^{2k}) + 3^{2k} + 7 = 8(3^{2k}) + 4L = 4(2(3^{2k}) + L)$.

So $4|(3^{2(k+1)} + 7)$, and we see that S_{k+1} is true.

Hence S_k implies S_{k+1} .

Therefore, by the principle of mathematical induction, S_n is true for all $n \in \mathbb{N}$.

→ Which of the following statements is correct?

- a) The proposition is false but the proof is correct.
- b) The proof contains arithmetic mistakes which make it incorrect.
- c) The proof incorrectly assumes what it is trying to prove.
- d) The proof is a correct proof of the stated result.
- e) None of the above.

3. (a) Show that there is no integer x satisfying the equation $2x + 1 = 5x - 4$
 (Hint: evaluate mod 3 and see what happens)

(b) Show that there is no integer x satisfying the equation $18x^2 + 39x - 7 = 0$

(c) Show that the system of equations

$$\begin{aligned} 11x - 5y &= 7 \\ 9x + 10y &= -3 \end{aligned}$$

has no integer solution.

(Hint: reduce mod 5)

(d) Show that the system of equations

$$\begin{aligned} 24x - 5y &= 10, \\ 11x - 9y &= 13. \end{aligned}$$

has no integer solutions.

4. Let X, Y, Z be non-empty sets. Let $f: X \rightarrow Y$ be surjective and let $g: Y \rightarrow Z$ be surjective. Must it follow that the composition of the two functions $g \circ f: X \rightarrow Z$ be surjective? Give proof or counterexample.

5. Is the converse to problem # 2 true? Give proof or counterexample.
 (Begin by stating the converse!)

6. (a) Is 4^{100} divisible by 3? (use modular arithmetic)

(b) What is the last digit in the expansion of 4^{100} ?

7. (a) Using *mathematical induction*, prove that $10^{n+1} + 4(10^n) + 4$ is divisible by 9, for all positive integers n .

(b) Prove the result of part (a) by using *modular arithmetic*!

Which is easier?

8. Let $A = \{1, 2, 3, 4, 5\}$, and let

$R = \{(1, 1), (1, 3), (1, 4), (2, 2), (2, 5), (3, 1), (3, 3), (3, 4), (4, 1), (4, 3), (4, 4), (5, 2), (5, 5)\}$ define an equivalence relation on A . (You may wish to check this!)

Which of the following is an *equivalence class*?

- a) $\{1, 2, 3\}$ b) $\{2, 3, 5\}$ c) $\{1, 3, 4\}$ d) $\{1, 2\}$ e) $\{1, 2, 3, 4, 5\}$

I tell them if they will occupy themselves with the study of mathematics, they will find in it the best remedy against the lusts of the flesh.

- Thomas Mann, **The Magic Mountain**
