

FIRST LOOK AT THE DERIVATIVE

Introducing the derivative

1. Which of the following graphs (a) – (d) could represent the slope at every point of the function graphed below, labeled Figure 2.6?

Figure 2.6

2. Which of the following graphs (a) – (d) could represent the slope at every point of the function graphed in Figure 2.11?

Figure 2.11

3. Mehitable, the cat, lives on the x -axis. Graphs of her *position*, *velocity*, and *acceleration* during the time interval

$-0.7 < t < 4.3$ appear below. Which is which? Explain.

4. The graph of a function $g(x)$ is given below.

Sketch a graph of $g'(x)$. Label the axes.

5. The function $C(r)$ is the total cost, in dollars, of paying off a car loan borrowed at an interest rate of r % per year.

What are the units of $C'(r) = \frac{dC}{dr}$?

- (a) Year/\$ (b) \$/Year (c) \$/(%/Year) (d) (%/Year)/\$

What is the practical meaning of $C'(5)$?

- (a) The rate of change of the total cost of the car loan is $C'(5)$.
 (b) If the interest rate increases by 1%, then the total cost of the loan increases by about $C'(5)$.
 (c) If the interest rate increases by 1%, then the total cost of the loan increases by about $C'(5)$ when the interest rate is 5%.
 (d) If the interest rate increases by 5%, then the total cost of the loan increases by about $C'(5)$.

What is the sign of $C'(5)$?

- (a) Positive
 (b) Negative
 (c) Not enough information

6. The temperature, Y , in Fahrenheit, of a cold yam placed in a hot oven is given by $Y = g(t)$, where t is the time in minutes since the yam was placed into the oven.

- (a) What is the sign of $g'(t)$? Why?
 (b) What are the units of $g'(20)$? What is the *practical meaning* of the statement $g'(20) = 2$?

7. For some painkillers, the size of the dose, D , given depends upon the weight of the patient, W . Thus, $D = H(W)$, where D is in milligrams and W is in pounds.

- (a) Interpret the statements $H(140) = 120$ and $H'(140) = 3$ in terms of this painkiller.
 (b) Use the information in the statements in part (a) to estimate $H(145)$.

8. Suppose that $C(T)$ is the cost of heating Albertine's house, in dollars per day, when the *outside* temperature is T degrees Fahrenheit.

- (a) What does $C(19) = 8.67$ mean in practical terms? (Use appropriate units.)
- (b) What does $C'(19) = -0.55$ mean in practical terms? (Use appropriate units.)
- (c) If $C(19) = 8.67$ and $C'(19) = -0.55$, approximately what is the cost of heating Albertine's house when the outside temperature is 16 degrees Fahrenheit? (Use appropriate units.)

9. The cost C (in thousands of dollars) of building a house that is x square feet, by the function $C = F(x)$.

- (a) Explain the *meaning* of the statement: $F(1600) = 140$.
- (b) Give the *practical interpretation* of the statement: $F'(1600) = 0.1$.
- (c) Using the information given in parts (a) and (b), *estimate* the cost of building a house that is 1680 square feet.

10. Use geometric differentiation on the function $y = \sin x$. Can you guess what the derivative function is?

11. Given the following graph of $y = f(x)$, use "geometric differentiation" to sketch the graph of dy/dx .

(If you are curious, the equation of this curve is $y = x^5 + \sin(21x) - 4x^3$)

12. Below is the graph of a velocity function of Albertine riding her mountain bike. The units on the vertical axis are in *kilometers per hour*, and the units on the horizontal axis are in *hours*. Positive velocity means motion away from the starting position; negative velocity means motion toward the starting position.

Sketch a possible graph of Albertine's position function during the time interval $t = 0$ to $t = 10$.

I turn away with fright and horror from the lamentable evil of functions that do not have derivatives.

- Charles Hermite (in a letter to Thomas Jan Stieltjes)

Using Mathematica to plot derivatives

```
Plot[x Sin[x], {x, 0, 8}]
```

```
f[x_] := x Sin[x]
```

```
f[9]
```

```
9 Sin[9]
```

```
f[9.0]
```

```
9 Sin[9]
```

```
3.70907
```

```
Plot[{f[x], f'[x]}, {x, 0, 8}]
```
