

# CLASS DISCUSSION: CARDINALITY (CONTINUED)

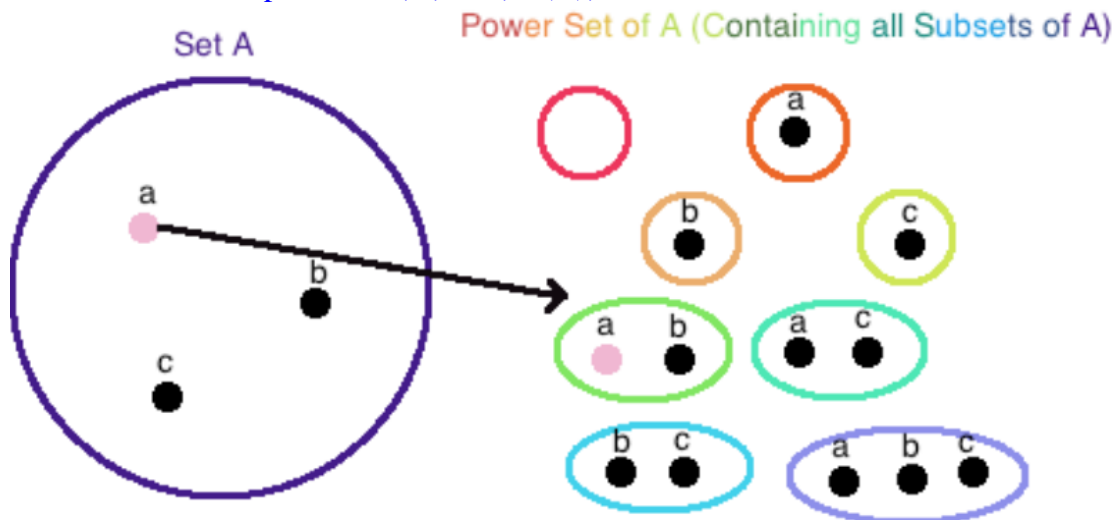

8 April 2019

- I**
- (a) Show that a subset of a countable set is either finite or countable.
  - (b) Show that if  $A$  and  $B$  are disjoint countable sets then so is the union of  $A$  and  $B$ .  
What if  $A$  and  $B$  are not disjoint?
  - (c) Show that if  $A$  and  $B$  are countable sets then so is the Cartesian product of  $A$  and  $B$ .
  - (d) Prove that a countable union of countable sets is countably infinite.
  - (e) Prove that the set of rational numbers strictly between 0 and 1 is countable.
  - (f) Demonstrate that  $\mathbf{Q}$  is countable.

**II** Using Cantor's diagonal argument, prove that  $\mathbf{R}$  is not countable.

**III** (a) Let  $X$  be a set. Recall the definition of the power set,  $\mathcal{P}(X)$ , of  $X$ .

- (a) Show that the power set of a finite set is finite. In such case, describe the relationship between  $|X|$  and  $|\mathcal{P}(X)|$ .

In this case  $\mathbf{a}$  is a member of  $f(\mathbf{a})$ .

- (b) Let  $X = \{a, b, c, d\}$  and let  $F: X \rightarrow \mathcal{P}(X)$  be defined by:  
 $F(a) = \{a, c, d\}$ ,  $F(b) = \{a, d\}$ ,  $F(c) = \emptyset$ ,  $F(d) = \{d\}$ . Find  $D^* = \{j \in X \mid j \notin F(j)\}$
- (c) Let  $G: \mathbf{N} \rightarrow \mathcal{P}(\mathbf{N})$  be defined by:  
 $G(a) = \{\text{all prime numbers, } p, \text{ such that } a \leq p \leq 2a\}$ . Find  $D^* = \{j \in X \mid j \notin G(j)\}$
- (d) Let  $H: \mathbf{Q} \rightarrow \mathcal{P}(\mathbf{Q})$  be defined by:  
 $H(z) = \{\text{all prime numbers, } p, \text{ such that } z \leq p \leq 2z\}$  Find  $D^* = \{q \in X \mid q \notin H(q)\}$

(e) Let  $X = \mathbf{R}$  and let  $V: X \rightarrow \mathcal{P}(X)$  be defined by:

$$V(a) = \begin{cases} \{0\} & \text{if } a \leq 0 \\ (a, a+1) & \text{if } a \in Q^+ \sim Z \\ [a-1, a] & \text{if } a \text{ is a positive irrational number} \\ \{a, a+3\} & \text{if } a \in \mathbf{N} \end{cases}$$

Is  $V$  well-defined? If so, find  $D^* = \{z \in X \mid z \notin V(z)\}$

(f) Prove *Cantor's Theorem* in the special case that  $X$  is countably infinite.

$$\mathbf{N} \left\{ \begin{array}{lll} 1 & \longleftrightarrow & \{4, 5\} \\ 2 & \longleftrightarrow & \{1, 2, 3\} \\ 3 & \longleftrightarrow & \{4, 5, 6\} \\ 4 & \longleftrightarrow & \{1, 3, 5\} \\ \vdots & \vdots & \vdots \end{array} \right\} \mathcal{P}(\mathbf{N})$$

(g) Prove *Cantor's Theorem* for the general case:  $X$  and  $\mathcal{P}(X)$  are not of the same cardinality.
