Intermediate Methods in Applied Statistics and Biostatistics

Timothy E. O'Brien
Loyola University Chicago

Table of Contents

1. Introduction and Background
    - 1.1. Introduction
    - 1.2. Random Variables and Sampling Theory
    - 1.3. Statistical Methods for a Single Sample
    - 1.4. Statistical Methods for Two or More Independent Samples
    - 1.5. Statistical Methods for Categorical (Count) Data
    - 1.6. Simple Linear Regression Methods
    - 1.7. One- and Two-Way ANOVA
    - 1.8. References

2. Linear Regression and Correlation
    - 2.1. Introduction
    - 2.2. Simple Linear Regression
    - 2.3. Multiple Linear Regression
    - 2.4. Testing Compound Hypothesis
    - 2.5. Indicator ("Dummy") Variables and Linear Regression
    - 2.6. Confidence Intervals and Hypothesis Testing Methods
    - 2.7. Additional Notes on Linear Regression
        - 2.7.1. The Analysis of Covariance for Three or More Groups
        - 2.7.2. Outliers, Influential Points, and Violations of MLR Assumptions
    - 2.8. Appendix
    - 2.9. References

3. Experimental Design and the Analysis of Designed Studies
    - 3.1. Introduction
    - 3.2. Contrasts, One- and Two-Way ANOVA
    - 3.3. The Paired T-Test and Other Block Designs
    - 3.4. Crossover Designs
    - 3.5. Mixed, Nested and Split-Plot Designs – Analyzing Data with Random Effects
        - 3.5.1. Mixed Models
        - 3.5.2. Nested Models
        - 3.5.3. Split-Plot Experiments
    - 3.6. Miscellaneous Extensions Involving Linear Models and ANOVA
        - 3.6.1. The Lack of Fit Test in SLR and a Heteroskedastic Extension
        - 3.6.2. Extending ANOVA for Non-Constant Variance
        - 3.6.3. Introduction to Optimal Design Strategies
        - 3.6.4. Box-Cox Transformations
    - 3.7. Appendices
        - 3.7.1. SAS Program and Output for Example 3.16
        - 3.7.2. SAS Program and Output for Example 3.17
        - 3.7.3. SAS Program for Example 3.18
    - 3.8. References

4. Generalized Linear Models: Logistic, Log-Linear and Multicategory Logit Models
    4.1. Introduction
    4.2. Binary Logistic Regression
    4.3. Log-Linear Models
    4.4. The Proportional Odds Model for Ordinal Logits
    4.5. Appendices
        4.5.1. Transforming the Dose Scale
        4.5.2. Connecting Multicategory Logit Models using the Generalized Ordinal Logit Model
    4.6. References

5. Gaussian and Generalized Nonlinear Models
    5.1. Introduction
    5.2. Nonlinear Modelling
        5.2.1. Choosing an Appropriate Model
        5.2.2. Parameter Starting Values and Issues of Convergence
        5.2.3. Assessing Model Fit
        5.2.4. Parameter Estimation
    5.3. Gaussian Nonlinear Model Illustrations
    5.4. Exponential Family (Generalized) Nonlinear Model Illustrations
    5.5. Measures of Curvature, Nonlinearity and Asymmetry
    5.6. Appendices
        5.6.1. Theoretical Results Associated with Wadley's Problem
        5.6.2. Predicted Values for Example 5.15 for Two Model Functions
        5.6.3. SAS/IML program for Example 5.17
        5.6.4. Generalized Linear and Nonlinear Models and Matrix Notation
    5.7. References

6. Bioassay, Relative Potency and Similar Compound Synergy
    6.1. Introduction
    6.2. Assessing Relative Potency for Direct Assays
    6.3. Assessing Relative Potency for Indirect Assays
    6.4. Assessing Interaction using the Finney Models
    6.5. Assessing Interaction using the Basic Separate Ray Model
    6.6. Extensions of the Basic Finney and Separate Ray Models
        6.6.1. Experiments Involving Blocks
        6.6.2. The Extended Separate Ray Model for Horizontal and Vertical Rays
        6.6.3. Assessing Interactions Using Percentages Other than 50%
        6.6.4. Ray Designs with Cut Lines – Horizontal Combination Indices
        6.6.5. Modelling Interactions Involving Three Similar Compounds
        6.6.6. Assessing Interactions for Mutually Nonexclusive Substances
        6.6.7. Combination Indices in Factorial Settings
    6.7. The Fieller-Creasy Problem
    6.8. Appendices
        6.8.1. SAS/IML Program for Example 6.3
        6.8.2. The Equivalence of the Finney_4 and the Equi-Slope Separate Ray Models
        6.8.3. Modelling Combination Indices and Effective Fractions using Polynomials
        6.8.4. The Extended Separate Ray Model for Horizontal and Vertical Rays – Additional Details
        6.8.5. SAS/IML Program and Output for Example 6.20
    6.9. References

7. Repeated Measures and Mixed Linear and Nonlinear Models
- 7.1. Introduction
- 7.2. Classical Repeated Measures Designs and Analysis
- 7.3. Random Parameter Models and Other Hierarchical Models
- 7.4. Linear and Nonlinear Models with Time Series Errors
- 7.5. Conditional Logistic Models and Generalized Estimating Equations
- 7.6. References

8. Survival Data Analysis
- 8.1. Introduction
- 8.2. Censored Data and Notation
- 8.3. Comparison of Survival Functions Using the Cox PH Model
- 8.4. Comparison of Survival Functions Using the AFT Model
- 8.5. Non-Normal Simple Linear Regression with Censored Measurements
- 8.6. A Nonlinear Model for Interval-Censored Measurements
- 8.7. Detecting Interaction in the Presence of Censored Measurements
- 8.8. Appendices
  - 8.8.1. SAS Program and Output for Binary Logistic fit in Example 8.5
  - 8.8.2. SAS Program and Output for Interval-Censored Model fit in Example 8.5
- 8.9. References

9. Multivariate Statistical Analysis
- 9.1. Introduction
- 9.2. The Multivariate Normal and Wishart Distributions
- 9.3. Hotelling's T^2 Tests
- 9.4. Multivariate Analysis of Variance
- 9.5. Analysis of Multivariate Crossover Design Data
- 9.6. Multivariate Linear Regression
- 9.7. Multivariate Nonlinear Regression
- 9.8. Bivariate Binomial Modelling and Methods
- 9.9. Appendices
  - 9.9.1. SAS Program and Output for Multivariate Nonlinear Model in Example 9.6
  - 9.9.2. SAS Program and Output for Bivariate Binomial Models in Example 9.7
- 9.10. References

10. Optimal Experimental Design and Applications (forthcoming)

11. Further Topics (forthcoming)

12. References (forthcoming; now at end of respective chapters)
